MATH 521 (Section 001) Prof. Meade

Exam 1 24 February 2015 University of South Carolina Spring 2015

Name: Key

## Instructions:

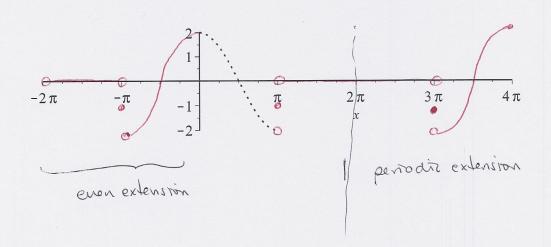

- 1. There are a total of 4 problems on 5 pages. Check that your copy of the exam has all of the problems.
- 2. No electronic or other inanimate objects can be used during this exam. All questions have been designed with this in mind and should not involve unreasonable manual calculations.
- 3. Be sure you answer the questions that are asked.
- 4. You must show all of your work to receive full credit for a correct answer. Correct answers with no supporting work will be eligible for at most half-credit.
- 5. Your answers must be clearly labeled and written legibly on additional sheets of paper (that I will provide). Be sure each sheet contains your name and the work for each question is clearly labeled.
- 6. Check your work. If I see *clear evidence* that you checked your answer (when possible) <u>and</u> you *clearly indicate* that your answer is incorrect, you will be eligible for more points than if you had not checked your work.

| Problem | Points | Score |
|---------|--------|-------|
| 1       | 16     |       |
| 2       | 24     |       |
| 3       | 30     |       |
| 4       | 30     |       |
| Total   | 100    |       |

Good Luck!

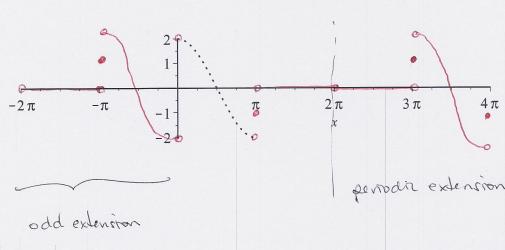

- 1. (16 points) Let  $f(x) = \begin{cases} 2\cos(x), & 0 \le x \le \pi \\ 0, & \pi < x \le 2\pi \end{cases}$ .
  - (a) Graph the sum of the Fourier cosine series for f(x) on  $[-2\pi, 4\pi]$  on the axes provided.

extend to [-27,0] by the even-extension. Then make periodic uppriod tu

(b) Graph the sum of the Fourier sine series for f(x) on  $[-2\pi, 4\pi]$  on the axes provided.

extend to [-27,0] by the odd extension then make periodiz w/period tit

2. (24 points) Find all eigenvalues and eigenvectors of  $X'' + \lambda X = 0$ , X'(0) = X(L) = 0. (Assume L is a positive constant.) Be sure to consider the cases with  $\lambda < 0$ ,  $\lambda = 0$ , and  $\lambda > 0$  separately.

Case I: 
$$\lambda < 0$$
 ( $\lambda = -\sigma^2$ )

 $X'' - \sigma X = 0$  has gen't solly  $X(x) = \alpha e^{-\sigma x}$ 
 $X'' = \sigma \alpha - \sigma b = 0$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e^{-\sigma x}$ 
 $X'(x) = \sigma \alpha e^{-\sigma x} - \sigma b e$ 

Case II: 
$$\chi = 0$$
 has sen'l solv  $\chi(x) = ax + b$   $\chi'(x) = a$ 

$$X'(0) = a = 0$$
  
 $X(L) = aL + b = b = 0$  ... no non-third solve.

COSUTI : 
$$\lambda > 0$$
 ( $\lambda = \sigma^2$ )

 $X'' + \sigma^2 X = 0$  has gen't solv  $X(x) = \alpha \cos(\sigma x) + b \sin(\sigma x)$ 
 $X'(x) = -\alpha \sigma \sin(\sigma x) + b \sigma \cos(\sigma x)$ 

$$X'(0) = b \sigma \cos(0) = b \sigma \Rightarrow b \Rightarrow 0$$
.  
 $X(L) = a \cos(\sigma L) = 0 \Rightarrow \cos(\sigma L) = 0$ 

$$\sigma = (2n-1) \frac{\pi}{2L} \quad (odd multiple of 72)$$

eigenfunctions: 
$$X_n = \left(\frac{(2n-i)\pi}{2L}\right)^2$$
  
eigenfunctions:  $X_n(x) = \cos\left(\frac{(2n-i)\pi}{2L}\right)$ 

3. (30 points) Suppose you have a long, thin, homogeneous bar of length L, with sides poorly insulated. Heat radiates freely from the bar along its length. Assuming a positive transfer coefficient A and a constant temperature T, in the surrounding medium. Assume the ends of the bar are insulated, and the initial temperature is f(x). The boundary value problem satisfied by u = u(x, t) is:

$$u_t = ku_{xx} - A(u - T), \quad 0 < x < L, t > 0$$
 (1)

$$u_x(0,t) = u_x(L,t) = 0, t > 0$$
 (2)

$$u(x,0) = f(x), \quad 0 < x < L.$$
 (3)

(a) Let w(x,t) = u(x,t) - T. Find the boundary value problem satisfied by w.

$$W_{\pm} = U_{\pm} \qquad U_{\pm} = k u_{xx} - A(u-T) \qquad U_{x}(0, \pm) = 0 \qquad u(x,0) = f(x).$$

$$W_{x} = u_{x} \qquad W_{\pm} = k w_{xx} - Aw \qquad w_{x}(0, \pm) = 0 \qquad w(x,0) \pm T = f(x)$$

$$W_{xx} = u_{xx} \qquad u_{x}(L, \pm) = 0 \qquad w(x,0) = f(x).$$

(b) Let  $w(x,t) = e^{\alpha x + \beta t} v(x,t)$ . Show that, with  $\alpha = 0$  and  $\beta = A$ , v satisfies the boundary value problem:

$$v_t = k v_{xx}, \qquad 0 < x < L, t > 0 \tag{4}$$

$$v_x(0,t) = v_x(L,t) = 0, t > 0$$
 (5)

$$v(x,0) = (f(x) - T), \quad 0 < x < L.$$
 (6)

$$v(x,0) = (f(x)-T), \quad 0 < x < L.$$

$$w_{t} = e^{\alpha x + \beta t}$$

$$= e^{\alpha x + \beta t} (v_{t} + \beta v)$$

$$w_{t} = kw_{xx} - Aw$$

$$e^{\alpha x + \beta t} (v_{t} + \beta v) = k (e^{\alpha x + \beta t}) (v_{xx} + \alpha \alpha v_{x} + \alpha^{2}v) - Ae^{\alpha x + \beta t}$$

$$v_{t} + \beta v = k (v_{xx} + 2\alpha v_{x} + \alpha^{2}v - Av)$$

$$v_{t} = kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx} + 2k\alpha v_{x} + (\alpha^{2} - A - \beta)v$$

$$= kv_{xx}$$

W (x,0) = f(x) -T (c) Solve the boundary value problem for v found in (b).

e-40 v(x,0) = f(x)-T 1.V(x,0)=f(x)-T.

The problem in (4), (5), (6) is a standard heat equation with insulated ends. Its solution is  $V(x,t) = \frac{a_0}{2} + \sum_{k=0}^{\infty} a_k \cos(\frac{n\pi x}{L}) e^{-k(\frac{n\pi}{L})^2 t}$ 

where  $a_n = \frac{2}{L} \int (f(x) - T) \cos(\frac{n\pi x}{L}) dx$  (n=0,1,2,...)

Note that the overall solve for the original problem, (1), (2), (3), 73:

U(xit) = W(xit) + T = T + e^{At} V(xit) = T + e^{At} (ao + 2) an was (next) e^{-k(next)^2t}

4. (30 points) Consider the following boundary value problem for a wave equation:

$$u_{tt} = 9u_{xx} + 4x, \qquad 0 < x < 1, t > 0 \tag{7}$$

$$u(0,t) = u(1,t) = 0, t > 0$$
 (8)

$$u(x,0) = 0, u_t(x,0) = 1, \quad 0 < x < 1.$$
 (9)

(a) Find a function f(x) such that u(x,t) = v(x,t) + f(x) where v(x,t) satisfies a standard wave equation  $(v_{tt} = c^2 v_{xx})$  with both ends held at the rest position (v(0, t) = v(1, t) = 0).

$$W(x,t) = V(x,t) + f(x)$$

$$W_t = V_t$$

$$W_t$$

ave equation 
$$(v_{tt} = c^2 v_{xx})$$
 with both ends field at the rest position  $(v(0, t) = v(1, t) = 0)$ .

$$u_{tt} = q_{uxx} + 4x$$

$$q_{tt}(x) + 4x = 0 \qquad u(0, t) = v(0, t) + f(0) = 0 \Rightarrow f(0) = 0.$$

$$v_{tt} = q_{tt}(x) + 4x$$

$$v_{tt}(x) = -\frac{4}{9}x$$

$$v_{tt}(x) = -\frac{2}{9}x$$

$$f''(x) = -\frac{1}{9}x$$
  
 $f'(x) = -\frac{2}{9}x^{2}+0$   
 $f(x) = \frac{2}{27}x^{2}+0$ 

(b) Find the initial conditions satisfied by v(x,t).

$$u(x,0) = v(x,0) + f(x) = 0$$
  $u_{\pm}(x,0) = v_{\pm}(x,0) = 1$ 

(c) Find the general form for the solution to the boundary value problem for v. (If you don't get a definite answer for (b), use the initial conditions v(x,0) = F(x) and  $v_t(x,0) = F(x)$ G(x).)

$$A^{F}(x^{1}y) = 1$$
  
 $A(x^{1}y) = A(x^{1}y) = 0$   
 $A^{F}(x^{1}y) = A(x^{1}y) = 0$   
 $A^{F}(x^{1}y) = A(x^{1}y) = 0$ 

This is the heat exection with 
$$c=3$$
,  $L=1$  and ends held at zero. The general solution is 
$$V(x;t) = \sum_{n=1}^{\infty} \sin(n\pi x) \left(\alpha_n \cos(3n\pi t) + b_n \sin(3n\pi t)\right)$$
 where  $\alpha_n = 2 \int_0^1 -f(x) \sin(n\pi x) dx$ 
$$3n\pi b_n = 2 \int_0^1 1 \sin(n\pi x) dx$$

(d) What is the solution u(x,t) to the original boundary value problem? (Express Fourier coefficients as unevaluated definite integrals.)

$$U(x;t) = V(x;t) + f(x)$$

$$= \sum_{n=1}^{\infty} \sin(n\pi x) \left(a_n \cos(3n\pi t) + b_n \sin(3n\pi t)\right) - \frac{2}{27} x^3 + \frac{2}{27} x.$$
