

Mathematics 122 Homework #2

Important note: When I assign reading I am assuming that you are going to do it. I will usually start class by asking if there are any questions. If I don't get questions on some reading it is then fair for me to assume that you have done it and understand it. It is then fair game for quizzes and tests.

1. Read §1.2 in the text especially on supply and demand curves pages 13–14 and proportionality page 15.
2. Pages 17 #8, #9, #10, #11ab and #12 (I will only go over these if there are questions in class. They are fair game for quizzes.)
3. Read pages 22–28 on linear functions. This is important material. Among the things you should be certain you know are what slope means, how to use slope to determine if a table of values is linear, how to find the equation of lines give either a point and the slope, or given two points.
4. Pages 30–31 problems 1–9.
