## Mathematics 172 Homework

We wish to understand how to approximate the solutions to a rate equation of the form

$$
P^{\prime}=f(P)
$$

where $f(P)$ is some function. Some examples would be

$$
P^{\prime}=-.3 P\left(1-\frac{30}{P}\right)
$$

or, to use a different dependent variable

$$
\frac{d y}{d t}=-.5 \frac{y}{10+y^{2}}
$$

The standard method for dealing with such problems is Euler's method. The basic idea is that if $\Delta t$ is very small, then

$$
P^{\prime}(t) \approx \frac{P(t+\Delta t)}{\Delta t}
$$

This is nothing more than the definition of the derivative. We can rearrange this to get

$$
P(t+\Delta t) \approx P(t)+P^{\prime}(t) \Delta t
$$

So far we have not used that $P$ is the solution to a rate equation. If We also have $P^{\prime}=f(P)$ then this last approximate can be rewritten as

$$
P(t+\Delta t) \approx P(t)+f(P(t)) \Delta t
$$

1. Let

$$
P^{\prime}=10-3 P .
$$

It $P(2)=6.2$ estimate $P(2.3)$.
Answer: In this problem $f(P)=10-3 P, t=2$, and $\Delta t=.3$. We then have

$$
\begin{aligned}
P(2.3) & =P(t+\Delta t) \\
& =P(2+.3) \approx P(2)+f(P(2))(.3) \\
& =6.2+(10-3 \cdot 6.2)(.3) \\
& =3.62
\end{aligned}
$$

2. If

$$
\frac{d N}{d t}=.3 N+.9
$$

and $N(3)=2$ estimate $N(3.1)$.
Answer: In this case $f(N)=.3 N+.9$ and we have

$$
\begin{aligned}
N(3.1) & \approx N(3)+f(N(3))(.1) \\
& =2+(.3 \cdot 2+.9)(.1) \\
& =2.15
\end{aligned}
$$

The problem with this is that it only gives good approximations when $\Delta t$ is small. The way around this, and this is Euler's idea, is to take lots of small steps. So we choose a step size $\Delta t$ and set

$$
t_{k}=k \Delta t
$$

Thus

$$
t_{0}=0, \quad t_{1}=\Delta 1, \quad t_{2}=2 \Delta t, \quad t_{k}=2 \Delta t,
$$

and so forth. We then have

$$
t_{k+1}=t_{k}+\Delta t .
$$

Now given the initial value problem

$$
P^{\prime}=f(P), \quad P(0)=P_{0} .
$$

Non generate a sequence of values $P_{1}, P_{2}, P_{3}, \ldots$ by

$$
P_{1}=P_{0}+f\left(P_{0}\right) \Delta t, \quad P_{2}=P_{1}+f\left(P_{1}\right) \Delta t, \quad P_{3}=P_{2}+f\left(P_{2}\right) \Delta t \quad \ldots
$$

In general to go from one step to the next

$$
P_{k+1}=P_{k}+f\left(P_{k}\right) \Delta t .
$$

Then we have the approximation

$$
P\left(t_{k}\right) \approx P_{k}
$$

3. Use this method to approximate $P(1)$ by taking five steps of size $\Delta t=.2$ where

$$
\frac{d P}{d t}=.2 P\left(1-\frac{P}{30}\right), \quad P(0)=20
$$

Answer: Here we have $P_{0}=20$ and the method of taking a step is

$$
P_{k+1}=P_{k}+.2 P_{k}\left(1-\frac{P_{k}}{30}\right)
$$

This gives values in the table

| $k$ | $t_{k}$ | $P_{k}$ |
| :--- | :--- | :--- |
| 0 | 0.0 | 20.000 |
| 1 | 0.2 | 20.2666666666667 |
| 2 | 0.4 | 20.5296829629630 |
| 3 | 0.6 | 20.7889131047351 |
| 4 | 0.8 | 21.0442310848229 |
| 5 | 1.0 | 21.2955207789472 |

This gives the approximation $P(1) \approx 21.2955$. If we had done steps of size $\Delta t=.1$ the table would be

| $k$ | $t_{k}$ | $P_{k}$ |
| :--- | :--- | :--- |
| 0 | 0.0 | 20 |
| 1 | 0.1 | 20.1333333333333 |
| 2 | 0.2 | 20.2657659259259 |
| 3 | 0.3 | 20.3972803987348 |
| 4 | 0.4 | 20.5278599749331 |
| 5 | 0.5 | 20.6574884843315 |
| 6 | 0.6 | 20.7861503670312 |
| 7 | 0.7 | 20.9138306763180 |
| 8 | 0.8 | 21.0405150808059 |
| 9 | 0.9 | 21.1661898658449 |
| 10 | 1.0 | 21.2908419342038 |

so that this time we get the approximation $P(1) \approx 21.2908$. I had the compute to if for 100 steps of size $\Delta t=.1$ and got $P(1) \approx 21.2866423243231$ and for 1000 steps of size $\Delta t=.001 P(1) \approx 21.2862229752552$.
4. If

$$
N^{\prime}=.02 N(10-N) \quad N(0)=13
$$

(a) Estimate $N(2)$ by taking two steps of size $\Delta t=1$.

Answer: The table is

| $k$ | $t_{k}$ | $N_{k}$ |
| :--- | :--- | :--- |
| 0 | 0.0 | 13 |
| 1 | 1.0 | 12.2200000000000 |
| 2 | 2.0 | 11.6774320000000 |

(b) Estimate $N(2)$ by taking four steps of size $\Delta t=.5$.

Answer: The table is

| $k$ | $t_{k}$ | $N_{k}$ |
| :--- | :--- | :--- |
| 0 | 0.0 | 13 |
| 1 | 0.5 | 12.6100000000000 |
| 2 | 1.0 | 12.2808790000000 |
| 3 | 1.5 | 12.0007670098736 |
| 4 | 2.0 | 11.7606596226082 |

(c) Estimate $N(2)$ by taking twenty steps of size $\Delta t=.1$. (Ok I don’t really expect anyone to do this by hand. You might try programing your calculator to do it.)

Answer: The table is

| $k$ | $t_{k}$ | $N_{k}$ |
| :--- | :--- | :--- |
| 0 | 0.0 | 13 |
| 1 | 0.1 | 12.9220000000000 |
| 2 | 0.2 | 12.8464838320000 |
| 3 | 0.3 | 12.7733492149483 |
| 4 | 0.4 | 12.7024992989132 |
| 5 | 0.5 | 12.6338423080137 |
| 6 | 0.6 | 12.5672912112465 |
| 7 | 0.7 | 12.5027634186949 |
| 8 | 0.8 | 12.4401805008611 |
| 9 | 0.9 | 12.3794679290903 |
| 10 | 1. | 12.3205548352573 |
| 11 | 1.1 | 12.2633737890653 |
| 12 | 1.2 | 12.2078605914660 |
| 13 | 1.3 | 12.1539540828539 |
| 14 | 1.4 | 12.1015959648148 |
| 15 | 1.5 | 12.0507306343198 |
| 16 | 1.6 | 12.0013050293644 |
| 17 | 1.7 | 11.9532684851359 |
| 18 | 1.8 | 11.9065725998832 |
| 19 | 1.9 | 11.8611711097283 |
| 20 | 2.0 | 11.8170197717343 |

(d) Finally for this initial value problem estimate $N(200)$. Answer: $N(200) \approx 10$.
