5. Recall that $D_{3}$ is the smallest subgroup of the group of rigid motions which contains $\rho$ and $\sigma$, where $\rho$ is rotation counter clockwise by $120^{\circ}$ fixing the origin and $\sigma$ is reflection of the $x y$ plane across the $x$ axis. List 4 subgroups of $D_{3}$ in addition to $D_{3}$ and \{id\}. (I do not need to see any details.)

$$
\begin{aligned}
& \{i \theta, \sigma\} \\
& \{i \theta, \sigma \rho\} \\
& \left\{i \phi, \sigma \rho^{2}\right\} \\
& \left\{i \alpha, \rho, \rho^{2}\right\}
\end{aligned}
$$

6. Let $x$ and $y$ be elements of the group $(G, *)$. Suppose that the inverse of $x$ is called $x^{-1}$ and the inverse of $y$ is called $y^{-1}$. Write the inverse of $x * y$ in terms of $x^{-1}$ and $y^{-1}$. Explain why your answer is correct.

The incuse of $x * y$ is $y^{-1} * x^{-1}$ recuse

$$
(x * y) *\left(y^{-1} * x^{-1}\right)=x *\left(y * y^{-1}\right) * x^{-1}=x * x^{-1}=i 0 .
$$
