

I changed my mind. I decided that it is not reasonable to make you turn in these problems before the exam.

**MATH 701 – FALL 2023**  
**HOMEWORK 5**  
**DUE MONDAY, OCTOBER 30 BY THE BEGINNING OF CLASS.**

9. (True or False) If true, prove it. If false, give a counterexample. Let  $G$  be a group. If  $x$  and  $y$  are elements of  $G$  of finite order, then  $xy$  has finite order.
10. (True or False) If true, prove it. If false, give a counterexample. Let  $G$  be a group. If  $x$  and  $y$  are elements of  $G$  of finite order and  $xy = yx$ , then the order of  $xy$  is equal to the least common multiple of the order of  $x$  and the order of  $y$ .
11. Let  $I$  be an index set. Suppose that for each  $i \in I$ ,  $G_i$  is a group. Consider the direct product  $\prod_{i \in I} G_i$ . For each  $i_0 \in I$ , let  $\text{proj}_{i_0} : \prod_{i \in I} G_i \rightarrow G_{i_0}$  be the natural projection map. Let  $G$  be a group and, for each  $i$ , let  $\phi_i : G \rightarrow G_i$  be a group homomorphism. Prove that there exists a unique group homomorphism  $\Phi : G \rightarrow \prod_{i \in I} G_i$  so that the diagram

$$\begin{array}{ccc} G & \xrightarrow{\exists! \Phi} & \prod_{i \in I} G_i \\ & \searrow \phi_{i_0} & \downarrow \text{proj}_{i_0} \\ & & G_{i_0} \end{array}$$

commutes for all  $i_0 \in I$ .

12. Let  $I$  be an index set. Suppose that for each  $i \in I$ ,  $G_i$  is a group. Consider the direct sum  $\bigoplus_{i \in I} G_i$ . For each  $i_0 \in I$ , let  $\text{incl}_{i_0} : G_{i_0} \rightarrow \bigoplus_{i \in I} G_i$  be the natural inclusion map. Let  $G$  be an Abelian group and, for each  $i$ , let  $\phi_i : G_i \rightarrow G$  be a group homomorphism. Prove that there exists a unique group homomorphism  $\Phi : \bigoplus_{i \in I} G_i \rightarrow G$  so that the diagram

$$\begin{array}{ccc} G & \xleftarrow{\exists! \Phi} & \bigoplus_{i \in I} G_i \\ & \swarrow \phi_{i_0} & \uparrow \text{incl}_{i_0} \\ & & G_{i_0} \end{array}$$

commutes for all  $i_0 \in I$ .

**Remark.** In case it is not already obvious, if  $i_0$  is an element of the index set  $I$ , then

$$\text{proj}_{i_0} : \prod_{i \in I} G_i \rightarrow G_{i_0}$$

is the projection map which sends the arbitrary element  $(g_i)_{i \in I}$  of  $\prod_{i \in I} G_i$  to  $g_{i_0}$  and

$$\text{incl}_{i_0} : G_{i_0} \rightarrow \bigoplus_{i \in I} G_i$$

is the inclusion map which sends the arbitrary element  $g_{i_0}$  of  $G_{i_0}$  to the element  $(h_i)_{i \in I}$  of  $\bigoplus_{i \in I} G_i$ , where

$$h_i = \begin{cases} \text{the identity element of } G_i, & \text{if } i \neq i_0, \text{ and} \\ g_{i_0}, & \text{if } i = i_0. \end{cases}$$
