

$$1) a) v(8) = 4 \quad \text{and} \quad v(10) = 2$$

$$m = \frac{v(10) - v(8)}{10 - 8} = \frac{2 - 4}{2} = \frac{-2}{2} = -1.$$

or

$$m = \frac{v(8) - v(10)}{8 - 10} = \frac{4 - 2}{-2} = \frac{2}{-2} = -1.$$

Note that from above I can ~~use~~ use $v(8)$ or $v(10)$ to find b .

$$v(8) = -1 \cdot 8 + b$$

$$4 = -8 + b$$

$$b = 12$$

$$v(10) = -1 \cdot 10 + b$$

$$2 = -10 + b$$

$$b = 12$$

So

$$v(t) = -t + 12.$$

$$b) v(1) = 4 \quad v(3) = 5$$

$$m = \frac{v(1) - v(3)}{1 - 3} = \frac{-1}{-2} = \frac{1}{2}$$

or

$$m = \frac{v(3) - v(1)}{3 - 1} = \frac{5 - 4}{3 - 1} = \frac{1}{2}$$

$$m = \frac{1}{2}$$

c) Note: Since the question does not specify positive or negative acceleration, overall ~~an~~ acceleration could be considered. However, it doesn't make a difference here. The greatest acceleration is from $0 \leq t \leq 1$. The reason it is from 0 to 1 is that it is the "steepest" on that interval. One could also do the algebra to find the slope of the line segments.

2)
